

中山大学本科生期末考试

考试科目：《编译原理》（A 卷答案）

学年学期：2016 学年第一学期 姓 名： _____
学 院/系：数据科学与计算机学院/软件工程学 号： _____
考试方式：闭卷 年级专业： _____
考试时长：120 分钟 班 别： _____

警示 《中山大学授予学士学位工作细则》第八条：“考试作弊者，不授予学士学位。”

----- 以下为试题区域，共九道大题，总分 100 分，考生请在答题纸上作答 -----

1. Write regular expressions for the following languages (8 points).

a) All strings over $\{0, 1\}$ that do not contain consecutive zeros (4 points).

$(0?1)^*0?$

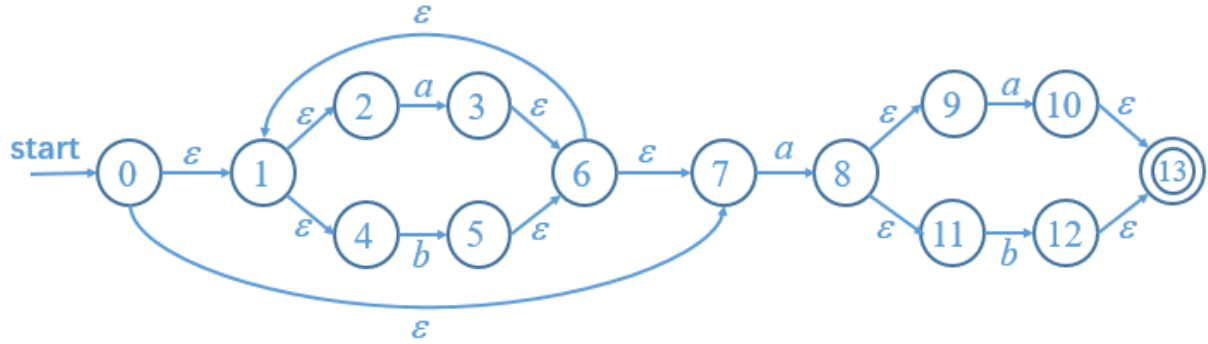

b) All strings representing a nonnegative binary number (without leading zeros) which is a multiple of 8 (4 points).

$0 \mid 1(1|0)^*000$

2. Consider the following regular expression (17 points):

$(a \mid b)^* a (a \mid b)$

a) Based on the Thompson Algorithm, construct the NFA from the above regular expression (8 points).

b) Convert the NFA into a DFA with minimum number of states (9 points).

$$\epsilon\text{-closure}(\{0\}) = \{0, 1, 2, 4, 7\}$$

$$\epsilon\text{-closure}(\text{move}(\{0, 1, 2, 4, 7\}, 'a')) = \epsilon\text{-closure}(\{3, 8\}) = \{1, 2, 3, 4, 6, 7, 8, 9, 11\}$$

$$\epsilon\text{-closure}(\text{move}(\{0, 1, 2, 4, 7\}, 'b')) = \epsilon\text{-closure}(\{5\}) = \{1, 2, 4, 5, 6, 7\}$$

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 3, 4, 6, 7, 8, 9, 11\}, 'a')) = \epsilon\text{-closure}(\{3, 8, 10\}) = \{1, 2, 3, 4, 6, 7, 8, 9, 10, 11, 13\}$$

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 3, 4, 6, 7, 8, 9, 11\}, 'b')) = \epsilon\text{-closure}(\{5, 12\}) = \{1, 2, 4, 5, 6, 7, 12, 13\}$$

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 4, 5, 6, 7\}, 'a')) = \epsilon\text{-closure}(\{3, 8\}) = \{1, 2, 3, 4, 6, 7, 8, 9, 11\}$$

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 4, 5, 6, 7\}, 'b')) = \epsilon\text{-closure}(\{5\}) = \{1, 2, 4, 5, 6, 7\}$$

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 3, 4, 6, 7, 8, 9, 10, 11, 13\}, 'a')) = \epsilon\text{-closure}(\{3, 8, 10\}) = \{1, 2, 3, 4, 6, 7, 8, 9, 10, 11, 13\}$$

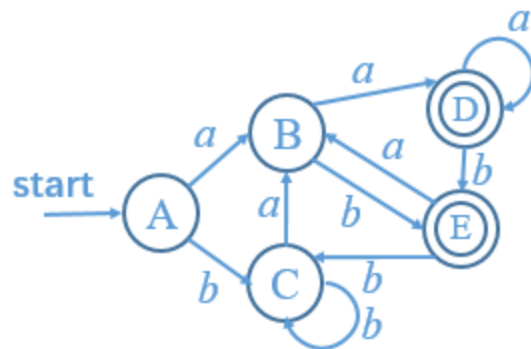

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 3, 4, 6, 7, 8, 9, 10, 11, 13\}, 'b')) = \epsilon\text{-closure}(\{5, 12\}) = \{1, 2, 4, 5, 6, 7, 12, 13\}$$

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 4, 5, 6, 7, 12, 13\}, 'a')) = \epsilon\text{-closure}(\{3, 8\}) = \{1, 2, 3, 4, 6, 7, 8, 9, 11\}$$

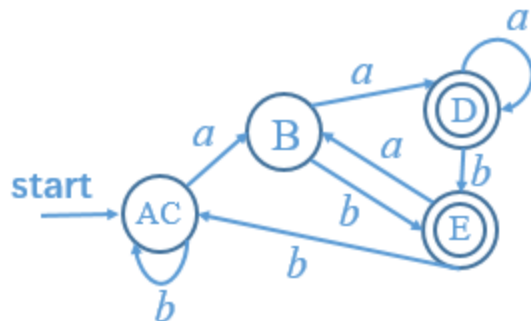

$$\epsilon\text{-closure}(\text{move}(\{1, 2, 4, 5, 6, 7, 12, 13\}, 'b')) = \epsilon\text{-closure}(\{5\}) = \{1, 2, 4, 5, 6, 7\}$$

NFA states	DFA state	a	b
{0, 1, 2, 4, 7}	A	B	C

{1, 2, 3, 4, 6, 7, 8, 9, 11}	B	D	E
{1, 2, 4, 5, 6, 7}	C	B	C
{1, 2, 3, 4, 6, 7, 8, 9, 10, 11, 13}	D	D	E
{1, 2, 4, 5, 6, 7, 12, 13}	E	B	C

Minimized DFA:

3. Consider the following CFG (9 points):

$$S \rightarrow +SS \mid -SS \mid a$$

and the string $+a-aa$.

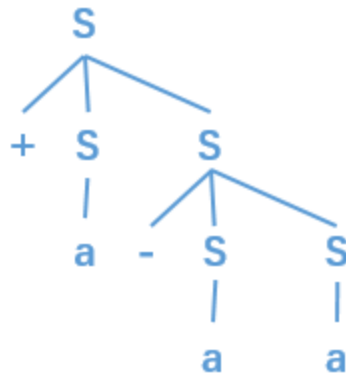

a) Give a leftmost derivation for the string (3 points).

$$S \Rightarrow +SS \Rightarrow +aS \Rightarrow +a-SS \Rightarrow +a-aS \Rightarrow +a-aa$$

b) Give a rightmost derivation for the string (3 points).

$$S \Rightarrow +SS \Rightarrow +S-SS \Rightarrow +S-Sa \Rightarrow +S-aa \Rightarrow +a-aa$$

c) Give a parse tree for the string (3 points).

4. Write CFGs for the following languages (8 points):

a) $L = \{a^n b^m c^n \mid m \geq 0, n \geq 1\}$ (4 points).

$$S \rightarrow aSc \mid aAc$$

$$A \rightarrow bA \mid \varepsilon$$

b) All strings over $\{a, b\}$ that begin and end with the same letter (4 points).

$$S \rightarrow aAa \mid bAb \mid a \mid b$$

$$A \rightarrow aA \mid bA \mid \varepsilon$$

5. Consider the following CFGs (18 points):

$$S \rightarrow i(E)t(E)X \mid E$$

$$X \rightarrow e(E) \mid \varepsilon$$

$$E \rightarrow aY \mid bY$$

$$Y \rightarrow c(E) \mid \varepsilon$$

where $i, t, e, a, b, c, ($ and $)$ are terminals.

a) Compute the FIRST and FOLLOW sets for all non-terminals (8 points).

Non-terminal	FIRST	FOLLOW
S	i, a, b	\$
X	e, ε	\$
E	a, b), \$
Y	c, ε), \$

b) Construct an LL(1) parsing table for the grammar (8 points).

	i	t	e	a	b	c	()	\$
S	$S \rightarrow i(E)t(E)X$			$S \rightarrow E$	$S \rightarrow E$				
X			$X \rightarrow e(E)$						$X \rightarrow \varepsilon$
E				$E \rightarrow aY$	$E \rightarrow bY$				
Y						$Y \rightarrow c(E)$		$Y \rightarrow \varepsilon$	$Y \rightarrow \varepsilon$

c) Is this grammar LL(1)? Why? (2 points)

Yes, because no conflicts can be found in the LL(1) parsing table.

6. Consider the following CFG (12 points):

$S \rightarrow aAD \mid aBe \mid bBS \mid bAe$

$A \rightarrow g$

$B \rightarrow g$

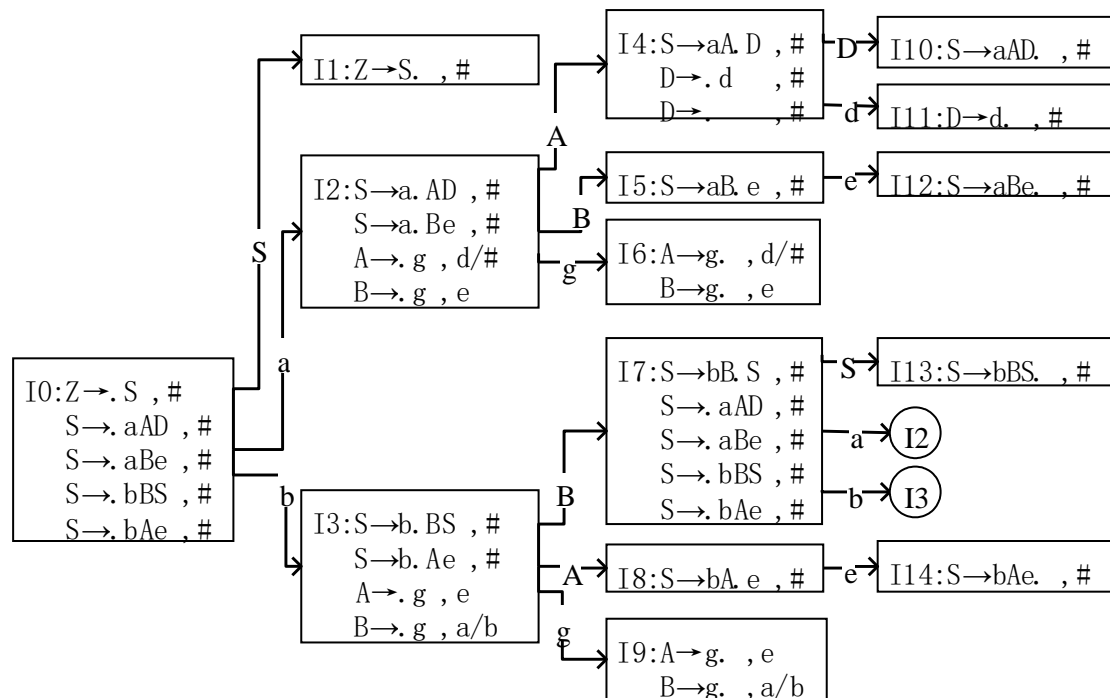

$D \rightarrow d \mid \varepsilon$

augment the grammar and construct the LR(1) sets of items for the augmented grammar.

首先拓广 $G[S]$ 为 $G[Z]$:

0: $Z \rightarrow S$	1: $S \rightarrow aAD$	2: $S \rightarrow aBe$
3: $S \rightarrow bBS$	4: $S \rightarrow bAe$	5: $A \rightarrow g$
6: $B \rightarrow g$	7: $D \rightarrow d$	8: $D \rightarrow \varepsilon$

构造 $G[Z]$ 的 LR (1) 项目族为:

7. The following grammar generates binary strings and their complements (10 points).

$F \rightarrow B$
 $\quad \mid \neg B$

$B \rightarrow B0$

| $B1$

| 0

| 1

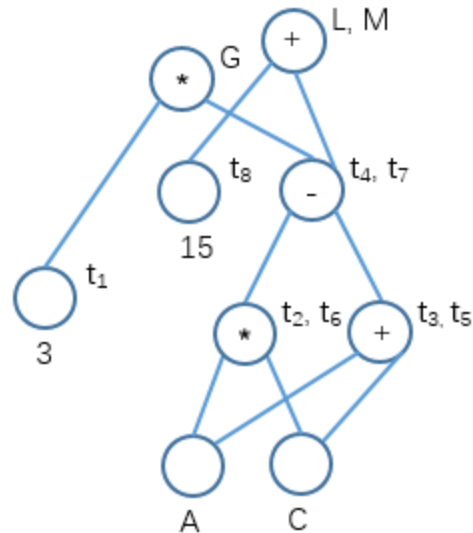

The value of a (non-negated) string is just the decimal value of the binary number the string represents; the value of a negated string is the decimal value of the string with 1's replaced by 0's and 0's replaced by 1's. For example, the value of 010 is 2 and -010 is 5. Design a syntax-directed definition (SDD) for the above grammar such that the non-terminal F has an attribute F.val which keeps the value of an input string generated by F. Please do NOT modify the grammar.

产生式	语义规则
$F \rightarrow B$	$B.c = \text{false}, F.val = B.val$
$F \rightarrow \neg B$	$B.c = \text{true}, F.val = B.val$
$B \rightarrow B_1 0$	$B_1.c = B.c, B.val = B_1.val * 2 + (B.c ? 1 : 0)$
$B \rightarrow B_1 1$	$B_1.c = B.c, B.val = B_1.val * 2 + (B.c ? 0 : 1)$
$B \rightarrow 0$	$B_1.c = B.c, B.val = (B.c ? 1 : 0)$
$B \rightarrow 1$	$B_1.c = B.c, B.val = (B.c ? 0 : 1)$

8. Consider the following basic block (10 points):

1)	$t_1 = 3$
2)	$t_2 = A * C$
3)	$t_3 = A + C$
4)	$t_4 = t_2 - t_3$
5)	$G = t_1 * t_4$
6)	$t_5 = A + C$
7)	$t_6 = A * C$
8)	$t_7 = t_6 - t_5$
9)	$t_8 = t_1 * 5$
10)	$L = t_8 + t_7$
11)	$M = L$

a) Construct the DAG of the above basic block (5 points).

- b) Assume that only G, L and M will be used after the basic block. Give the optimized three-address statement sequence (5 points).

1)	$t_2 = A * C$
2)	$t_3 = A + C$
3)	$t_4 = t_2 - t_3$
4)	$G = 3 * t_4$
5)	$L = 15 + t_4$
6)	$M = L$

9. Consider the following fragment of three-address instructions (8 points):

- (1) $b := 1$
- (2) $b := 2$
- (3) if $w \leq x$ goto B
- (4) $e := b$
- (5) goto B
- (6) A: goto D
- (7) B: $c := 3$
- (8) $b := 4$
- (9) $c := 6$
- (10) D: if $y \leq z$ goto E
- (11) goto End
- (12) E: $g := g + 1$
- (13) $h := 8$
- (14) goto A
- (15) End: $h := 9$

Please partition these three-address instructions into basic blocks, and draw the control flow graph. You may draw the resulting graph directly, but you must mark

each node by number $n\sim m$ indicating that the corresponding basic block consists of instructions n through m , inclusive.
